• takes one or more functions as arguments (i.e., procedural parameters),

Definitions

(Wikipedia:) In mathematics and computer science, a higher-order function is a function that does at least one of the following:

- takes one or more functions as arguments (i.e., procedural parameters),
- returns a function as its result.

The need of higher-order functions
Function pointers are not enough

```
auto sum = std::accumulate(std::begin(numbers), std::end(numbers), 0);
```

```
auto sum = std::accumulate(std::begin(numbers), std::end(numbers), 0);
auto item = std::accumulate(std::begin(keys), std::end(keys), root,
        [](auto && a, auto && b){ return a[b]; }
);
```

```
auto result_fut = get_calculation().then([](auto && calculation) {
    return calculation.evaluate();
});
```

Intro

```
auto fut = std::accumulate(std::begin(statements), std::end(statements),
    make_readv_future(),
    [](auto && future, auto && stmt) {
        return future.then([=](auto && result) {
            if (!result.should continue()) {
                return result;
            }
            return stmt->simplify();
        }):

Problems with std::function: move-only objects

• std::function requires Copyable to be constructed

How it looks like
How it works
Problems with std::function: move-only objects
Problems with std::function: const-correctness
Problems with erased wrappers: signature deduction

- std::function requires Copyable to be constructed
- it also requires it for copyability of std::function itself

- std::function requires Copyable to be constructed
- it also requires it for copyability of std::function itself
- this precludes the use of it for move-only types

- std::function requires Copyable to be constructed
- it also requires it for copyability of std::function itself
- this precludes the use of it for move-only types
- opinion: the default function type shouldn't be copyable;

- std::function requires Copyable to be constructed
- it also requires it for copyability of std::function itself
- this precludes the use of it for move-only types
- opinion: the default function type shouldn't be copyable; instead we should have a separate type for copyable functions

```
struct some_function_object {
   int i = 0;
   int operator()() { return ++i; }
   int operator()() const { return i; }
};
```

```
struct some_function_object {
   int i = 0;
   int operator()() { return ++i; }
   int operator()() const { return i; }
};
some_function_object f1;
assert(f1() == 1); // ok; non-const overload selected
```

```

- 6. The end

Ownership and (a)sync
Value vs reference semantics
Ownership erasure
Removing static information is not always good
The search for unique function

Ownership and (a)sync

 whether we care about ownership for the sake of correctness or not depends on a kind of an algorithm we are passing a function into

Ownership and (a)sync
Value vs reference semantics
Ownership erasure
Removing static information is not always good
The search for unique function

- whether we care about ownership for the sake of correctness or not depends on a kind of an algorithm we are passing a function into
- for synchronous algorithms, both semantics lead to legal behavior

Ownership and (a)sync Value vs reference semantics Ownership erasure Removing static information is not always good

The search for unique function

- whether we care about ownership for the sake of correctness or not depends on a kind of an algorithm we are passing a function into
- for synchronous algorithms, both semantics lead to legal behavior
- for asynchronous algorithms, reference semantics can lead to illegal behavior (dangling references)

Ownership and (a)sync
Value vs reference semantics
Ownership erasure
Removing static information is not always good

The search for unique function

- whether we care about ownership for the sake of correctness or not depends on a kind of an algorithm we are passing a function into
- for synchronous algorithms, both semantics lead to legal behavior
- for asynchronous algorithms, reference semantics can lead to illegal behavior (dangling references)
- for synchronous algorithms, we would like to benefit from performance improvements of function_ref

Ownership and (a)sync Value vs reference semantics Ownership erasure Removing static information is not always good

The search for unique function

- whether we care about ownership for the sake of correctness or not depends on a kind of an algorithm we are passing a function into
- for synchronous algorithms, both semantics lead to legal behavior
- for asynchronous algorithms, reference semantics can lead to illegal behavior (dangling references)
- for synchronous algorithms, we would like to benefit from performance improvements of function_ref
- for asynchronous algorithms, we would like to be able to select which semantics we want

Ownership and (a)sync
Value vs reference semantics
Ownership erasure
Removing static information is not always good
The search for unique_function

Value vs reference semantics

• value vs reference semantics should not be tied to an algorithm

Ownership and (a)sync
Value vs reference semantics
Ownership erasure
Removing static information is not always good
The search for unique function

- value vs reference semantics should not be tied to an algorithm
- an algorithm should be easy to be used correctly and hard to use incorrectly

- value vs reference semantics should not be tied to an algorithm
- an algorithm should be easy to be used correctly and hard to use incorrectly
- when faced with two different correct choices...

- value vs reference semantics should not be tied to an algorithm
- an algorithm should be easy to be used correctly and hard to use incorrectly
- when faced with two different correct choices... we should default to the one that is more inconvenient as the opt-in vs as the opt-out

- value vs reference semantics should not be tied to an algorithm
- an algorithm should be easy to be used correctly and hard to use incorrectly
- when faced with two different correct choices... we should default to the one that
 is more inconvenient as the opt-in vs as the opt-out
- opt-in pass-by-value is hard need to spell the type, use decltype or use auto in a separate statement to make a copy

- value vs reference semantics should not be tied to an algorithm
- an algorithm should be easy to be used correctly and hard to use incorrectly
- when faced with two different correct choices... we should default to the one that is more inconvenient as the opt-in vs as the opt-out
- opt-in pass-by-value is hard need to spell the type, use decltype or use auto in a separate statement to make a copy
- opt-in pass-by-reference is easy just support std::reference_wrapper

Ownership and (a)sync
Value vs reference semantics
Ownership erasure
Removing static information is not always good
The search for unique function

```
template<typename T>
struct reference_wrapper {
    reference_wrapper(T &);
    reference_wrapper(T &&) = delete;
    T & get() const;
    operator T &() const;
    template<typename... Args>
    auto operator()(Args &&...) const;
};
```

Ownership and (a)sync
Value vs reference semantics
Ownership erasure
Removing static information is not always good
The search for unique_function

Ownership erasure

```
some_callable foo;
std::function<void ()> bar = std::ref(foo);
```

Ownership and (a)sync
Value vs reference semantics
Ownership erasure
Removing static information is not always good
The search for unique_function

Ownership erasure

```
template<typename Function>
class my_function;
template<typename R, typename... Args>
class my_function<R (Args...)> {
    using invoke_t = R (*)(void *, Args &&...);
    invoke_t invoke = nullptr;
    std::unique_ptr<void, void (*)(void *)> data{ nullptr, +[](void *){} };
public:
    template<typename F>
    my_function(F f) {
        invoke = +[](void * data){ return (*reinterpret_cast<F *>(data))(std::forward<Args>(args)...); }
        data = { new F(std::move(f)), +[](void * ptr){ delete reinterpret_cast<F *>(ptr); } };
}
```

```
R operator()(Args &&... args) const { return invoke(data.get(), std::forward<Args>(args)...); }
```

Ownership and (a)sync
Value vs reference semantics
Ownership erasure
Removing static information is not always good
The search for unique_function

Ownership erasure

```
template<typename Function>
class my function:
template<typename R, typename... Args>
class my function < R (Args...) > {
    using invoke_t = R (*)(void *, Args &&...);
    invoke_t invoke = nullptr;
    std::unique_ptr<void, void (*)(void *)> data{ nullptr, +[](void *){} };
public:
    template<tvpename F>
    my_function(F f) {
        invoke = +[](void * data){ return (*reinterpret_cast<F *>(data))(std::forward<Args>(args)...); }
        data = { new F(std::move(f)), +[](void * ptr){ delete reinterpret_cast<F *>(ptr): } };
    template<typename F>
    my function(std::reference wrapper<F> f) {
        invoke = +[](void * data){ return (*reinterpret_cast<F *>(data))(std::forward<Args>(args)...); }
        data = { std::addressof(f.get()), +[](void *){} }:
    R operator()(Args &&... args) const { return invoke(data.get(), std::forward<Args>(args)...); }
```

Ownership and (a)sync
Value vs reference semantics
Ownership erasure
Removing static information is not always good
The search for unique_function

Removing static information is not always good

using my_function instead of function_ref in an interface loses some information

Ownership and (a)sync
Value vs reference semantics
Ownership erasure
Removing static information is not always good
The search for unique_function

- using my_function instead of function_ref in an interface loses some information
- using my_function instead of std::function does not lose information

Ownership and (a)sync
Value vs reference semantics
Ownership erasure
Removing static information is not always good
The search for unique_function

- using my_function instead of function_ref in an interface loses some information
- using my_function instead of std::function does not lose information no new capabilities, just a performance increase

Ownership and (a)sync
Value vs reference semantics
Ownership erasure
Removing static information is not always good
The search for unique_function

- using my_function instead of function_ref in an interface loses some information
- using my_function instead of std::function does not lose information no new capabilities, just a performance increase
- can lead to more subtle and harder to debug dangling references

Ownership and (a)sync
Value vs reference semantics
Ownership erasure
Removing static information is not always good
The search for unique_function

- using my_function instead of function_ref in an interface loses some information
- using my_function instead of std::function does not lose information no new capabilities, just a performance increase
- can lead to more subtle and harder to debug dangling references
- already a problem with std::function

Ownership and (a)sync
Value vs reference semantics
Ownership erasure
Removing static information is not always good
The search for unique_function

The search for unique_function

my_function doesn't require copyability

Ownership and (a)sync
Value vs reference semantics
Ownership erasure
Removing static information is not always good
The search for unique_function

The search for unique_function

- my_function doesn't require copyability
- this is sometimes very helpful (think lambdas that captured non-copyable objects)

Ownership and (a)sync
Value vs reference semantics
Ownership erasure
Removing static information is not always good
The search for unique function

The search for unique_function

- my_function doesn't require copyability
- this is sometimes very helpful (think lambdas that captured non-copyable objects)
- no current standard class that does this

Ownership and (a)sync
Value vs reference semantics
Ownership erasure
Removing static information is not always good
The search for unique_function

The search for unique_function

- my_function doesn't require copyability
- this is sometimes very helpful (think lambdas that captured non-copyable objects)
- no current standard class that does this
- P0288 "A polymorphic wrapper for all Callable objects" by David Krauss (again!)
